DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-3, 5-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over De (U.S. Patent 6,470,946) in view of Buchwalter et al. (U.S. Patent Publication 2002/0078559) and Hiyamizu et al. (U.S. Patent 4,906,011). De shows the method of processing a semiconductor workpiece, 402, by adhering the workpiece in intimate contact with an adhesive, 404, to a porous work carrier, 406, (column 5, lines 46-51) having through holes, 428, thinning the workpiece (column 1, lines 26-31), and then applying solvent through the porous work carrier to dissolve the adhesive (column 5, lines 63-67; column 6, lines 24-30) and separate the workpiece from the carrier (column 6, lines 36-55). De is silent as to the exact adhesive used, but teaches that various adhesives including epoxy and tape are conventionally used to adhere a wafer to a carrier (column 1, lines 33-40). De fails to show the porous carrier to have interconnected pores.

Buchwalter et al. teaches the use of a porous carrier, 404, can be used with adhesive to hold semiconductor elements to the carrier. Buchwalter et al. further teaches that a fluid can penetrate the porous carrier to release the elements from the carrier (paragraph 0053). It would have been obvious to one of ordinary skill in the art

Application/Control Number: 10/729,882

Art Unit: 1734

at the time the invention was made to use the porous carrier of Buchwalter et al. with interconnected pores as the carrier in the process of De because Buchwalter et al. teaches the similar construction and function of a porous carrier with interconnected pores to the porous carrier of De which does not have interconnected pores.

Furthermore, Buchwalter et al. teaches that semiconductor devices can be held on a porous carrier by vacuum, adhesive, or both (paragraph 0053). It would have been obvious to one of ordinary skill in the art at the time the invention was made to use vacuum in addition to the adhesive as it is applied to the carrier of De because Buchwalter et al. teaches that these can be used concurrently which would increase the holding strength of the carrier to the semiconductor wafer.

Hiyamizu et al. teaches that the depth of infiltration of adhesive into the pores of a porous vacuum chuck can be controlled by selecting parameters including the type and viscosity of the adhesive (column 3, lines 26-30). The choosing of an adhesive based upon its viscosity is a clear indication that the anticipated adhesives are in liquid form. It would have been obvious to one of ordinary skill in the art at the time the invention was made to use a liquid adhesive in the method of the references as combined because De suggests that liquid adhesives are conventionally used for holding a wafer to a carrier and Hiyamizu et al. shows that liquid adhesives are used to hold articles to porous vacuum chucks. It is further noted that liquid thermoplastic adhesives are hardened to attach two articles together. It would have been obvious to one of ordinary skill in the art at the time the invention was made to harden the adhesive

Application/Control Number: 10/729,882

Art Unit: 1734

of the references as combined to complete the adhesive bond between the porous vacuum chuck and the workpiece.

Page 4

Regarding claim 5, De shows the instantly claimed features but fails to disclose of what material the porous carrier is made. It is well known that metal carriers for thinning wafers are conventional. It would have been obvious to one of ordinary skill in the art at the time the invention was made to use any conventional material, such as metal for the carrier of De because these materials are conventionally used.

Regarding claim 11, which is depends from apparatus claim 10, material worked upon limitations are not given patentable weight in an apparatus claim.

Regarding claim 15, De further shows that a positive pressure can be applied on a side of the work carrier remote from the carrier (column 7, lines 28-49).

Regarding claims 16-23 the references as combined show the claimed limitations but fail to show the particular pore size and porosity. Hiyamizu et al. teaches that the porosity and pore size of a vacuum carrier is a result effective variable for such factors as adhesive infiltration (column 3, lines 26-39). It would have been obvious to one of ordinary skill in the art at the time the invention was made to design the carrier of the references as combined using routine optimization to determine the most effective pore size and porosity for the carrier for a given situation because Hiyamizu et al. teaches these variables to be situation specific.

Response to Arguments

3. Applicants' arguments filed January 5, 2007 have been fully considered but they are not persuasive. In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

Applicant's additional arguments fail to comply with 37 CFR 1.111(b) because they amount to a general allegation that the claims define a patentable invention without specifically pointing out how the language of the claims patentably distinguishes them from the references.

Conclusion

4. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any

Art Unit: 1734

extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Mark A. Osele whose telephone number is 571-272-1235. The examiner can normally be reached on M-F 9:30-6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Philip Tucker can be reached on 571-272-1095. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
